

DATASHEET

Add AppNeta for a Better WiFi Network

Office infrastructure has evolved to mandate one, if not multiple, WiFi networks. From guest networks and BYOD to conference rooms and remote work, WiFi is a crucial part of office life and the primary connection point for many employees. If your employees are often on laptops, they depend on the WiFi more than wired connections. AppNeta can measure across all connections—WiFi, wired and even IPsec or SSL VPN tunnels.

Live Wired and Wireless Comparisons

In many modern offices, users move from meeting to meeting and rely on WiFi to connect to SaaS apps when they're not at their desk. At other offices, all users are connecting via WiFi. If you're monitoring a SaaS app like Salesforce with a wired connection, you'll likely see details like in the chart below. This shows the live wired connection between AppNeta's San Francisco office to our instance of Salesforce.

But AppNeta takes monitoring even further. Our monitoring points can become members of the WiFi network to accurately track end-user experience over the wireless network. Below, you can see that the real wireless performance is not the same. The capacity can be compared over both networks and monitored with that context.

Get the Benefits of Monitoring WiFi

Monitor WiFi Continuously

With AppNeta, you get always-on monitoring. By running our active testing tool, you'll see what happened leading up to an issue. You can configure alerts so you're never surprised by calls complaining that the WiFi is slow. You can measure over multiple access points or just one. And if you're remote, you no longer need to go on-site to fix WiFi issues.

See True WiFi Measurements for VoIP

WiFi monitoring is essential for measuring end-user experience. Because AppNeta deployment is on both the WiFi and the wired ethernet network, you can make active performance comparisons over both connection types. If you don't have 802.11ac everywhere, you might see simplex issues in video calls that don't exist in your hard-wired VoIP lines. Do your users know the difference? No, but they shouldn't have to. With AppNeta, you can ensure call quality on every interface your users need.

Provide a Consistent User Experience

IT infrastructure in every modern business includes multiple WiFi networks. Being able to identify user connection points and experience is crucial for troubleshooting when they call with performance issues. When you know which user and which connection are having problems, you can quickly correlate where problems occurred and know how to fix them.

ABOUT APPNETA

AppNeta is the leader in proactive end-user performance monitoring solutions built for the distributed digital enterprise. With AppNeta, IT and Network Ops teams can assure continual and exceptional delivery of business-critical applications. AppNeta's SaaS-based solutions give IT teams essential application and network performance data, allowing them to continuously monitor user experience across any application, network, data center or cloud. For more information, visit www.appneta.com.
